

Andrea Knauseder, BSc, MSc student †

Andrea passed away unexpectedly at the age of 27 in October 2021.

She has been a most valuable member of the SCAN-Unit for several years. After finishing her Bachelor's thesis on the role of expectancy in hypnotizability in 2019, she completed an internship at the SCAN Unit, which soon turned into a Master's thesis project. Andrea has been collaborating in a fMRI study, investigating the effects of hypnotic suggestions on pain perception and empathy. This project is now nearly finished, which would not have been possible without Andrea's invaluable and untiring help and dedication.

Andrea was a brilliant student with a keen interest in science. She is dearly missed and we shall always commemorate her as a dedicated and reliable colleague, and a very kind person.
